

1989457 - Recommendations When SAP Business One Application Shuts Down Unexpectedly

Component: SBO-BC-DMP (SAP Business One > System > Crashes), Version: 8, Released On: 31.03.2020

Symptom

SAP Business One client shuts down unexpectedly.

Cause

FAQ

Solution

Application Shutdown Reproducible Every Time

Troubleshooting Steps: Test Environment

You have verified that the scenario resulting in an application shutdown is reproducible every time you recreate the scenario. You can perform the following set of tests to help troubleshoot further.

Check the logical and physical integrity of all the objects in the database.

- For MSSQL refer to SAP Note [1466453](#) for details.
- For the SAP HANA platform refer to SAP Note [2353878](#) for details.

Check if the scenario is reproducible in SAP Business One demo database using the latest version and patch.

Check if the scenario is reproducible in a separate test environment.

Check if the scenario is reproducible when all user customizations are removed from the database. Refer to SAP Note [2079411](#) for details.

Check if the scenario is reproducible in the latest available version of SAP Business One.

The results of these tests will help determine the next steps in terms of troubleshooting your scenario. Log an incident with SAP Business One Support including the test results. We recommend using the *Report a Problem* functionality, which can be found inside the SAP Business One client from version 9.3. It will provide us with screenshots and additional system details as it records the scenario while you are using SAP Business One.

In addition, provide the SAP Business One log file for further analysis of the reported issue.

Please set up the log file settings as follows: *Help* → *Support Desk* → *Logger Settings*.

- *Business Information Level*: Errors, Warnings and Information
- *System Information Level*: Errors, Warnings and Information

Troubleshooting Steps: Customer Environment

If the above testing proves that the issue is not reproducible in a test environment, you can re-focus your testing directly in the customer environment.

Verify that the customer environment complies with the [supported platforms](#) and [hardware requirements](#).

Check if the issue occurs on all SAP Business One client workstations.

If it occurs only in specific workstations, check if the SAP Business One client is corrupted. Please refer to SAP Note [1989534](#) for details.

Perform a check for Operating System (OS) errors.

- From the Control Panel, choose *Administrative Tools* → *Event Viewer*.
- Expand *Windows Logs*.
- Check the Application and System logs for critical errors and errors.
- Resolve these errors.

Verify that the Windows user is at least a power user on the workstation.

Check if the issue is reproducible when running the SAP Business One application as an administrator.

1. Right-click the SAP Business One icon and choose *Run as Administrator*.
2. In the *User Account Control* dialog box, choose *Yes*.

Check if the issue is reproducible when all add-ons are disabled. Stop all add-ons from the SAP Business One *Main Menu*.

1. Choose *Administration* → *Add-ons* → *Add-on Manager*.
2. On the *Installed Add-ons* tab, stop all connected add-ons.

Application Shutdown is Random

In some cases the application shutdown is random, whereby if the user tries the same scenario another time it completes successfully. The SAP Business One application can shut down unexpectedly generating an error message to the user. Automatic dump file generation is disabled to comply with data protection standards. The end user can easily enable this functionality within the application. A dump file (.DMP) saves the current state of the application at the time of the shutdown. The dump file feature provides important details regarding the events which took place in SAP Business One up to the point of the application shutdown.

The application shutdown can happen only on specific workstations. Please refer to the troubleshooting steps in the customer environment to help you in this scenario. In case these troubleshooting steps fail to identify the root cause, please consider a re-install of the Windows OS as a solution.

In cases where the customer finds the application shutdown is happening randomly on all workstations, please refer to SAP Note [1009615](#) for details.

Other terms

crash, shutdown, terminates, runtime error, dmp, shut down
